

Event-Based Surveillance (EBS) Yearly M&E Report

Reporting Period: [ADD], 2025

Year to date 7-1-7 Metrics

%

Events **detected within 7 days** of event start

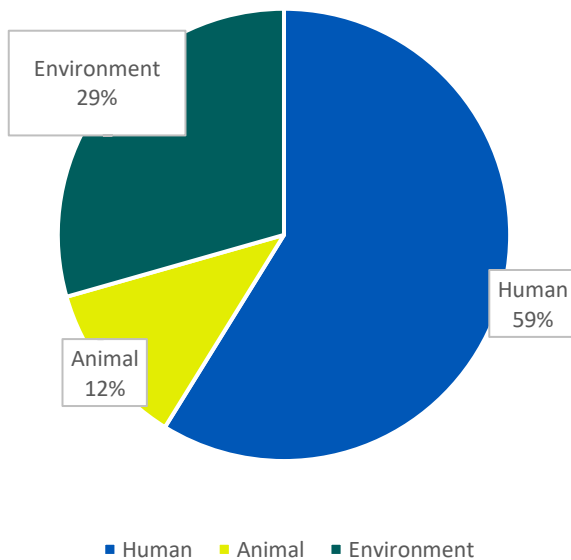

%

Events where an **alert was issued within 24 hours** of event detection

%

Events where an **initial response was completed within 7 days** of an alert

Type of events detected in 2025

Active events being monitored in [Country] [date to date]

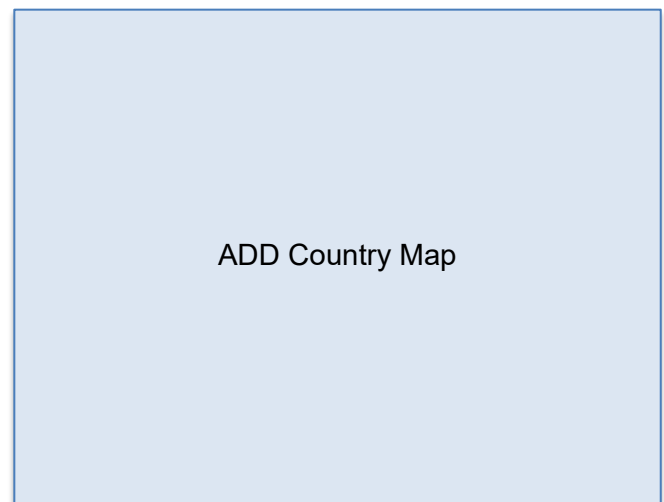

Table 1. Training and Supportive Supervision Status for 2025

Indicator	Number (%) by Quarter				Total
	Q1	Q2	Q3	Q4	
Multisectoral TWG meetings held					
Weekly EBS Reports Disseminated					
Simulation exercises conducted					
Staff trained on EBS					
New					
Refresher					
Staff implementing EBS					
Sites implementing EBS					
New sites established					
Sites that received a supervision visit					
Sites equipped ¹ to conduct EBS					
Sites reporting					
>90% Data completeness					
>90% Data accuracy					
Risk level validation exercise conducted					

¹ Equipped = signal list available, SOP/technical guidance available, equipment available and working, EBS staff knowledgeable

Table 2. EBS Process Completeness for 2025

Steps in Process		Number (%) by Detection Modality				Total
		Q1	Q2	Q3	Q4	
Signals detected		25 (25%)	25 (25%)	25 (25%)	25 (25%)	100
Signals that passed triage		10 (40%)				40 (40%)
Signals verified as events		5 (50%)				20 (50%)
Events that undergo risk assessment		5 (100%)				
Events characterized by risk level	Very High	1 (20%)				
	High	1 (20%)				
	Moderate	2 (40%)				
	Low	1 (20%)				
Events where an alert was issued	Very High	1 (100%)				
	High	1 (100%)				
	Moderate	2 (100%)				
	Low	0 (0%)				
Events responded to	Very High	1 (100%)				
	High	1 (100%)				
	Moderate	1 (50%)				
	Low	0 (0%)				

Table 3. Timely Reporting

Indicator	Number (%) by Detection Modality				Total
	Q1	Q2	Q3	Q4	
Timely detection					
Timely reporting					
Timely verification					
Timely risk assessment					
Timely notification/alert					
Timely initial effective response					
Sites reporting on time	1 (100%)	1 (100%)	7 (70%)	25 (83%)

Table 4. Action Items to Address

Action Item	Person responsible	Target Resolution Date

Calculation Notes and Triggers for Additional Analysis

Table 1

- **Multisectoral TWG meetings held:** Total number of TWG meetings held for the year by quarter.
- **Weekly EBS Reports Disseminated:** Total number of weekly EBS reports (or situation reports containing EBS data) disseminated for the year by quarter.
- **Simulation exercises conducted:** Total number of EWAR simulation exercises conducted for the year by quarter.
- **Staff trained to conduct EBS:** Total number of staff trained to implement EBS
 - New training: Total number (%) of staff trained that received on-boarding or initial training
 - Refresher training: Total number (%) of staff that received refresher training
- **Staff implementing EBS:** Total number of staff currently identified to implement EBS
- **Sites implementing EBS:** Total number of sites implementing EBS
 - **New Sites established:** Total number of new sites established over the year by quarter
 - **Sites that received a supportive supervision visit:** Total number of sites that received a supportive supervision visit by quarter.
 - **Sites equipped to conduct EBS:** Total number (%) of sites equipped to implement EBS, e.g. have signal list available, SOP/technical guidance available, equipment available and working, EBS staff knowledgeable
 - **Sites reporting:** Total number (%) of sites that reported signals/events by quarter. This can include an aspect of zero reporting (e.g. site periodically sharing information regarding no signals being detected) to ensure sites are still active and functioning.
 - **>90% Data completeness:** Total number (%) of sites with data that is greater than 90% complete by quarter. This is measured by reviewing the presence of key variables within the dataset (e.g. key dates, source and contact information).
 - **>90% Data accuracy:** Total number (%) of sites with data that is greater than 90% accurate by quarter. This is measured by reviewing the accuracy of key variables within the dataset (e.g. logical order of key dates, event characterization).
 - **Risk level validation exercise conducted:** Total number (%) of sites that conducted a risk assessment level validation exercise by quarter.

Table 2

- **Signals detected:** collect the total number detected and proportion of these broken down by modality (i.e. community, facility, media, hotline)
 - Note: it may be helpful to collect information on the source (newspaper name, facility name) of each signal as well for a more in-depth analysis on a yearly basis or during periodic evaluation.
- **Signals that passed triaged:** This is the number of signals detected minus the number of signals discarded (e.g. not relevant to EI or a duplicate). Collect the total number and the proportion of those that passed over those detected broken down by modality.
 - **Trigger for additional analysis:** if the proportion of signals that pass triage is small (e.g., 30% or less), look at reason why the signal is being discarded to understand if the triage process or signal definition needs to be improved.
- **Signals verified as events:** This is the number of signals that pass triage, undergo the process of verification, and are verified as events. Collect the total number and the proportion of those verified as events over the number that passed triage broken down by modality.
 - **Trigger for additional analysis:** all signals that pass triage should undergo verification. If a large proportion (e.g., >70%) of signals that pass triage were not verified as events, why? Were they discarded as not being true or was the process of verification not completed, and why? If you are unable to verify signals, you may need to identify new focal points or better understand why the existing focal points are not available to support this function.
- **Events that undergo risk assessment:** This is the number of verified events that undergo the process of risk assessment and are assigned a risk level. Collect the number and proportion of events that undergo risk assessment over the number of signals verified as events broken down by modality.
 - **Trigger for additional analysis:** all events should undergo the process of risk assessment. If any events are not undergoing this process, the team conducting this should be consulted to understand the reason and if retraining is needed.
- **Events characterized by risk level:** This is the number of events that have undergone the process of risk assessment broken down by the risk level assigned. Collect the number of events that underwent risk assessment by risk level and the proportion of the total assigned to each level.
 - **Trigger for additional analysis:** If a large proportion (e.g. >70%) of events are assigned a high or very high level of risk, a risk assessment validation exercise should be performed to ensure the appropriate level of risk is being assigned or if retraining is needed.
- **Events where an alert was issued:** This is the number of events where a notification was made to the response team for action. Collect the total number of events where an alert was issued by risk level and the proportion of those over the number of events that underwent risk assessment.
 - **Trigger for analysis:** Alerts should theoretically be issued for ALL events, if there are a large proportion of events where alerts are not being issued, this may require further analysis to understand why. Are these events that are primarily low risk and may not require an alert for action or is there a breakdown in communication between the team issuing alerts and those that respond to them.
- **Events responded to:** This is the number of events where an alert was issued that were responded to in some capacity.

[Name of Ministry – Country]

- **Note:** you will need to define the response activities that are associated with this indicator. The 7-1-7 guidance lists the following as initial response criteria that should be completed within 7 days of an alert:
 - Initiate investigation or deploy investigation/response team
 - Conduct epidemiologic analysis of burden, severity and risk factors, and perform in depth risk assessment
 - Obtain laboratory confirmation of the outbreak etiology
 - Initiate appropriate case management and infection prevention and control (IPC) measures in health facilities
 - Initiate appropriate public health measures in affected communities
 - Initiate appropriate risk communication and community engagement activities
 - Establish a coordination mechanism
- **Trigger for additional analysis:** for events where the risk has been characterized as low or moderate, a response may not be needed. However, if a large proportion of high/very high risk events are not being responded to, why is this not being done? Additional analysis may be warranted to better understand any bottleneck associated with not being able to adequately respond or if the risk level was inappropriately marked higher than it should have been.

Table 3

- **Timely detection (1):** Event detection date – Event start date; suggested within 7 days
- **Timely reporting (2):** Event reporting date – Event detection date
- **Timely triage (3):** Event triage date – Event detection date
- **Timely verification (4):** Event verification date – Event detection date; suggested within 24 hours
- **Timely risk assessment (5):** Risk assessment date – Event detection date; suggested within 48 hours
- **Timely notification/alert (6):** Alert date – Risk assessment date; suggested within a few hours
- **Timely initial effective response (7):** Initial response completion date – Response initiation date; suggested within 7 days
- **Sites reporting on time:** Number (%) of sites that met timeliness reporting metrics for all events detected
